Bucaramanga 2026

Dear Hiring Team,

I believe great software is not the result of writing more code, but of understanding the right problem before writing the first line. That mindset has guided my career from the very beginning and is one of the reasons I enjoy building enterprise software.

Before I start coding, I like to understand the business, analyze the problem, and break it down into clear, manageable steps until I find a practical solution. Over the years, I have learned that investing a little more time in analysis at the beginning often saves many hours during development, testing, and long-term maintenance.

I also enjoy learning and adopting new technologies when they genuinely improve the development process. In recent years, I have incorporated AI into my workflow—not as a replacement for engineering judgment, but as a tool to accelerate implementation, explore alternatives, and improve productivity. At the same time, I believe every solution should be fully understood before becoming part of a project. AI can speed up development, but the responsibility for understanding, validating, and maintaining the software always remains with the engineer.

I enjoy building robust solutions, paying attention to detail, and finding the right balance between quality, maintainability, and productivity. I value collaboration, continuous learning, and developing software that remains reliable, easy to maintain, and ready to evolve as business needs change.

I would welcome the opportunity to bring this mindset to your team and contribute to building software that delivers lasting value.

Thank you for considering my application. I look forward to the opportunity to discuss how my experience and engineering approach can contribute to your organization.

Sincerely,

Jorge Augusto Jaimes Jerez
